

Task 2.5

Models from 2.3:

- Name
- Ingredients
- Cooking time
- Difficulty

The only attribute I added was the option for the user to add an image to their recipe. In my experience, every online recipe shows an image of the completed dish, giving the user a visual of how the finished meal should look. A simple image could provide some additional direction to the person using the recipe, or it could potentially give the user an idea for creative deviation.

Full disclosure: To avoid potential copyright, I used Recraft.AI, which we were required to use in the Intro to Frontend Development course, to generate images of the recipes I added. My prompt for each recipe was "***Please create an image for {recipe name}.***"

My final list of models after 2.5:

- Name
- Ingredients
- Cooking time
- Difficulty
- Picture
